Problem Statement

Many farmers own multiple farms, making it difficult to manage all farm activities manually. Keeping track of crops, workers, expenses, irrigation, and harvest details for each farm is time-consuming and can lead to poor management and reduced profits. Therefore, there is a need for a single digital platform that allows farmers to manage all their farms, monitor activities, and track expenses from one place easily and efficiently.

Problem Solution

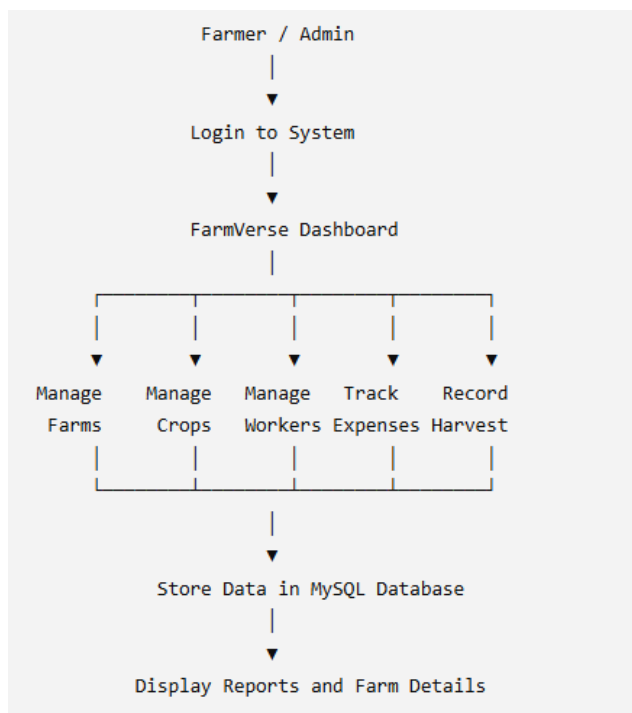

FarmVerse Precision Agriculture Management Platform is a web-based application that helps farmers manage multiple farms from one place.

The platform provides a centralized dashboard where farmers can:

- Manage multiple farms
- Monitor crop details
- Track farm expenses and income
- Manage workers
- Schedule irrigation and farming activities
- Store harvest records
- Generate reports for better decision making

This digital solution reduces manual work, improves farm management, and helps increase productivity and profitability.

Problem Architecture:

Architecture Explanation

1. **Farmer/Admin** logs into the FarmVerse application.
2. The user accesses the **Dashboard**.
3. From the dashboard, the user can:
 - Manage Farms
 - Manage Crops
 - Manage Workers
 - Track Expenses
 - Record Harvest Details
4. All the information is stored in the **MySQL Database**.
5. The system displays the updated information and reports to help the farmer manage all farms easily.

This is simple, easy to explain during a presentation, and perfectly suitable for the normal version of your project.

Tech Stack:

Frontend

- React.js
- HTML
- CSS
- JavaScript

Backend

- Java
- Spring Boot
- REST APIs

Database

- MySQL

Development Tools

- IntelliJ IDEA / Eclipse (Backend)
- Visual Studio Code (Frontend)
- MySQL Workbench
- Postman (API Testing)
- Git & GitHub (Version Control)
